Abstract

The fact that the Holy Qur'an contains knowledge that remains valid and true for all periods of time is a miracle by itself. Specially, the knowledge of human body and creation of life as mentioned in the Holy Qur'an is one of the greatest proofs that it is a word of God.

It was impossible for any human being to know and explain this very complicated topic in the simplest possible way that made sense at that time and remains accurate after 15 hundred years of continuous research.

Human embryology – a study of how human body develops in the womb of a mother is a fascinating topic that has intrigued the scientists for centuries. While new research is bringing out new information in embryology and anatomy, at the same time, pondering over verses of Holy Qur'an also brings new meaning to these verses.

The astonishing fact is that the verses of Holy Qur'an continue to remain current and newly derived interpretations are perfectly in line with the new research bewildering the minds with hidden treasures of Holy Qur'an.

This presentation demonstrates, how the Holy Qur'an beautifully starts with the mention of the creation of life from amino acids, originating from the elements of the earth – that are called building blocks of life, then from human sperm that joins with the human egg to form a clot. The clot then transforms into a lump of flesh which continues to evolve in the form of human body. During this process, various scientific phenomenon takes place that are mentioned in the Holy Qur'an in most simplified narration which is understandable to people of all times
